

M³ MODULE: GHOST DRIVING

A ghost driver solution automatically **detects vehicles driving in the wrong direction** on highways or any one-way road or in a tunnel.

Once the ghost driver has been detected, the solution sends out a warning message including the location, time of infraction. The purpose of such a solution is to warn drivers as early as possible of an approaching wrong way driver and to prevent any serious accident.

This information can be sent via many channels to warn the driver e.g. VMS, radio, push notifications, etc.

KEY FEATURES

- ▶ Configurable for **various vehicle categories**
- ▶ Detection of all ghost driving violations thanks to an **outstanding ANPR performance**
- ▶ Configurable alerting for ghost driving detections
