

# M<sup>3</sup> Module: Kiss & Ride

Kiss & Ride solutions allow to **easily monitor dedicated school drop-off and airport zones referred to as “Kiss & Ride”**. The parents should be warned of a given period of time to be able to safely drop off their children near to the school.

Drivers often stay much longer than usual in these designated parking areas and sometimes do not only drop their children from the car, give them a quick hug and then drive off immediately. This problem defeats the idea of such a defined restricted drop-area designed for short stay drivers just to drop off their kids at school in a safe well-protected environment.

Macq proposes a very efficient and flexible solution to survey temporary car parking drop-off points. These exclusive points of stay, usually quite close to the school entrance and considered as being quite a dangerous area, are monitored by artificially intelligent cameras which are capable of detecting a stopped vehicle that exceeds the amount of allocated time.

The camera will push the image containing also the make and model of the vehicle (option) to the web-based

## Key Features

- Choose your Kiss & Ride zones with our QCAM series
- You define the safety parameters, timeslots, whitelists, ...
- Be able to **monitor how drivers respect this limited time frame**
- **Create a safe zone** respecting the permanent or dynamic circumstances
- **Automatic generation of candidates** that didn't respect the limited time access
- **Connection with a VMS** sign on site to raise awareness
