M³ Module: Blacklist

The well-designed integrated blacklist module, also often referred to as a **hotlist** comprises a defined list of license plates detected by all the connected cameras in the field to a central server.

A blacklist is an easy-to-use and extremely powerful software module integrated into the Macq Mobility Manager platform to be able to quickly search for a wanted vehicle.

The blacklist module provides **automatic alerts** via various channels (e.g. mail, sms, push notifications), providing possible rapid intervention whenever necessary.

This module allows to **upload various blacklist types,** including a list of infractions (e.g. criminals, murderers, stolen vehicles, noninsured vehicles, etc.), and may include appropriate prioritization of each license plate.

Different file types (e.g. .csv, .xml etc.) may be uploaded and can be refreshed automatically.

The blacklist is a perfect traffic management accurate search tool for all those wishing to find and trave a blacklisted vehicle.

Key Features

- Blacklist definition via .csv or .xml format.

- Handles **up to 1,000,000 vehicles+.**

- Blacklist vehicles available in **real-time** and are **encrypted.**
